# 1 Datenstrukturen

## 1.1 Union-Find

```

1 vector<int> parent, rank2; //manche Compiler verbieten Variable mit Namen rank
2
3 int findSet(int n) { //Pfadkompression
4     if (parent[n] != n) parent[n] = findSet(parent[n]);
5     return parent[n];
6 }
7
8 void linkSets(int a, int b) { //union by rank
9     if (rank2[a] < rank2[b]) parent[a] = b;
10    else if (rank2[b] < rank2[a]) parent[b] = a;
11    else {
12        parent[a] = b;
13        rank2[b]++;
14    }
15 }
16
17 void unionSets(int a, int b) {
18     if (findSet(a) != findSet(b)) linkSets(findSet(a), findSet(b));
19 }

```

## 1.2 Segmentbaum

```

1 int a[MAX_N], m[4 * MAX_N];
2
3 int query(int x, int y, int k = 0, int X = 0, int Y = MAX_N - 1) {
4     if (x <= X && Y <= y) return m[k];
5     if (y < X || Y < x) return -1000000000; //ein "neutrales" Element
6     int M = (X + Y) / 2;
7     return max(query(x, y, 2 * k + 1, X, M), query(x, y, 2 * k + 2, M + 1, Y));
8 }
9
10 void update(int i, int v, int k = 0, int X = 0, int Y = MAX_N - 1) {
11     if (i < X || Y < i) return;
12     if (X == Y) {
13         m[k] = v;
14         a[i] = v;
15         return;
16     }
17     int M = (X + Y) / 2;
18     update(i, v, 2 * k + 1, X, M);
19     update(i, v, 2 * k + 2, M + 1, Y);
20     m[k] = max(m[2 * k + 1], m[2 * k + 2]);
21 }
22
23 void init(int k = 0, int X = 0, int Y = MAX_N - 1) {
24     if (X == Y) {
25         m[k] = a[X];
26         return;
27     }
28     int M = (X + Y) / 2;
29     init(2 * k + 1, X, M);
30     init(2 * k + 2, M + 1, Y);
31     m[k] = max(m[2 * k + 1], m[2 * k + 2]);
32 }

```

## 1.3 Range Minimum Query

```

1 vector<int> data(RMQ_SIZE);
2 vector<vector<int>> rmq(floor(log2(RMQ_SIZE)) + 1, vector<int>(RMQ_SIZE));
3
4 void initRMQ() {
5     for(int i = 0, s = 1, ss = 1; s <= RMQ_SIZE; ss=s, s*=2, i++) {
6         for(int l = 0; l + s <= RMQ_SIZE; l++) {
7             if(i == 0) rmq[0][l] = 1;
8             else {
9                 int r = l + ss;

```

```

10         rmq[i][l] = (data[rmq[i-1][l]] <= data[rmq[i-1][r]] ? rmq[i-1][l] : rmq[i-1][r]);
11     }
12 }
13 }
14 }
15 //returns index of minimum! [a, b)
16 int queryRMQ(int l, int r) {
17     if(l >= r) return l;
18     int s = floor(log2(r-l)); r = r - (1 << s);
19     return (data[rmq[s][l]] <= data[rmq[s][r]] ? rmq[s][l] : rmq[s][r]);
20 }

```

## 2 Graphen

### 2.1 Lowest Common Ancestor

```

1 //RMQ muss hinzugefuegt werden!
2 vector<int> visited(2*MAX_N), first(MAX_N, 2*MAX_N), depth(2*MAX_N);
3 vector<vector<int>> graph(MAX_N);
4
5 void initLCA(int gi, int d, int &c) {
6     visited[c] = gi, depth[c] = d, first[gi] = min(c, first[gi]), c++;
7     for(int gn : graph[gi]) {
8         initLCA(gn, d+1, c);
9         visited[c] = gi, depth[c] = d, c++;
10    }
11 }
12 // [a, b]
13 int getLCA(int a, int b) {
14     return visited[queryRMQ(min(first[a], first[b]), max(first[a], first[b]))];
15 }
16 //=> int c = 0; initLCA(0,0,c); initRMQ(); done!

```

### 2.2 Kürzeste Wege

#### 2.2.1 Algorithmus von DIJKSTRA

Kürzeste Pfade in Graphen ohne negative Kanten.

```

1 priority_queue<ii, vector<ii>, greater<ii> > pq;
2 vector<int> dist;
3 dist.assign(NUM_VERTICES, INF);
4 dist[0] = 0;
5 pq.push(ii(0, 0));
6
7 while (!pq.empty()) {
8     ii front = pq.top(); pq.pop();
9     int curNode = front.second, curDist = front.first;
10
11     if (curDist > dist[curNode]) continue;
12
13     for (int i = 0; i < (int)adjlist[curNode].size(); i++) {
14         int nextNode = adjlist[curNode][i].first, nextDist = curDist + adjlist[curNode][i].second;
15
16         if (nextDist < dist[nextNode]) {
17             dist[nextNode] = nextDist; pq.push(ii(nextDist, nextNode));
18         }
19     }
20 }

```

#### 2.2.2 BELLMANN-FORD-Algorithmus

Kürzestes Pfade in Graphen mit negativen Kanten. Erkennt negative Zyklen.

```

1 //n = number of vertices, edges is vector of edges
2 dist.assign(n, INF); dist[0] = 0;
3 parent.assign(n, -1);
4 for (i = 0; i < n - 1; i++) {
5     for (j = 0; j < (int)edges.size(); j++) {
6         if (dist[edges[j].from] + edges[j].cost < dist[edges[j].to]) {

```

```

7         dist[edges[j].to] = dist[edges[j].from] + edges[j].cost;
8         parent[edges[j].to] = edges[j].from;
9     }
10 }
11 }
12 //now dist and parent are correct shortest paths
13 //next lines check for negative cycles
14 for (j = 0; j < (int)edges.size(); j++) {
15     if (dist[edges[j].from] + edges[j].cost < dist[edges[j].to]) {
16         //NEGATIVE CYCLE found
17     }
18 }

```

### 2.2.3 FLOYD-WARSHALL-Algorithmus

Alle kürzesten Pfade im Graphen.

```

1 //initialize adjmat, adjmat[i][i] = 0, adjmat[i][j] = INF if no edge is between i and j, length
  otherwise
2 for (k = 0; k < MAX_V; k++) {
3     for (i = 0; i < MAX_V; i++) {
4         for (j = 0; j < MAX_V; j++) {
5             if (adjmat[i][k] + adjmat[k][j] < adjmat[i][j]) adjmat[i][j] = adjmat[i][k] + adjmat[k][j];
6         }
7     }
8 }

```

## 2.3 Strongly Connected Components (TARJANS-Algorithmus)

```

1 int counter, sccCounter, n; //n == number of vertices
2 vector<bool> visited, inStack;
3 vector< vector<int> > adjlist;
4 vector<int> d, low, sccs;
5 stack<int> s;
6
7 void visit(int v) {
8     visited[v] = true;
9     d[v] = counter;
10    low[v] = counter;
11    counter++;
12    inStack[v] = true;
13    s.push(v);
14
15    for (int i = 0; i < (int)adjlist[v].size(); i++) {
16        int u = adjlist[v][i];
17        if (!visited[u]) {
18            visit(u);
19            low[v] = min(low[v], low[u]);
20        } else if (inStack[u]) {
21            low[v] = min(low[v], low[u]);
22        }
23    }
24
25    if (d[v] == low[v]) {
26        int u;
27        do {
28            u = s.top();
29            s.pop();
30            inStack[u] = false;
31            sccs[u] = sccCounter;
32        } while (u != v);
33        sccCounter++;
34    }
35 }
36
37 void scc() {
38     //read adjlist
39
40     visited.clear(); visited.assign(n, false);

```

```

41  d.clear(); d.resize(n);
42  low.clear(); low.resize(n);
43  inStack.clear(); inStack.assign(n, false);
44  sccs.clear(); sccs.resize(n);
45
46  counter = 0;
47  sccCounter = 0;
48  for (i = 0; i < n; i++) {
49      if (!visited[i]) {
50          visit(i);
51      }
52  }
53  //sccs has the component for each vertex
54 }

```

## 2.4 Artikulationspunkte und Brücken

```

1  vector< vector<int> > adjlist;
2  vector<int> low;
3  vector<int> d;
4  vector<bool> isArtPoint;
5  vector< vector<int> > bridges; //nur fuer Bruecken
6  int counter = 0;
7
8  void visit(int v, int parent) {
9      d[v] = low[v] = ++counter;
10     int numVisits = 0, maxlow = 0;
11
12     for (vector<int>::iterator vit = adjlist[v].begin(); vit != adjlist[v].end(); vit++) {
13         if (d[*vit] == 0) {
14             numVisits++;
15             visit(*vit, v);
16             if (low[*vit] > maxlow) {
17                 maxlow = low[*vit];
18             }
19
20             if (low[*vit] > d[v]) { //nur fuer Bruecken
21                 bridges[v].push_back(*vit); bridges[*vit].push_back(v);
22             }
23
24             low[v] = min(low[v], low[*vit]);
25         } else {
26             if (d[*vit] < low[v]) {
27                 low[v] = d[*vit];
28             }
29         }
30     }
31
32     if (parent == -1) {
33         if (numVisits > 1) isArtPoint[v] = true;
34     } else {
35         if (maxlow >= d[v]) isArtPoint[v] = true;
36     }
37 }
38
39 void findArticulationPoints() {
40     low.clear(); low.resize(adjlist.size());
41     d.clear(); d.assign(adjlist.size(), 0);
42     isArtPoint.clear(); isArtPoint.assign(adjlist.size(), false);
43     bridges.clear(); isBridge.resize(adjlist.size()); //nur fuer Bruecken
44     for (int v = 0; v < (int)adjlist.size(); v++) {
45         if (d[v] == 0) visit(v, -1);
46     }
47 }

```

## 2.5 Eulertouren

- Zyklus existiert, wenn jeder Knoten geraden Grad hat (ungerichtet), bzw. bei jedem Knoten Ein- und Ausgangsgrad übereinstimmen (gerichtet).
- Pfad existiert, wenn alle bis auf (maximal) zwei Knoten geraden Grad haben (ungerichtet), bzw. bei allen Knoten

bis auf zwei Ein- und Ausgangsgrad übereinstimmen, wobei einer eine Ausgangskante mehr hat (Startknoten) und einer eine Eingangskante mehr hat (Endknoten).

- **Je nach Aufgabenstellung überprüfen, wie isolierte Punkte interpretiert werden sollen.**
- Der Code unten läuft in Linearzeit. Wenn das nicht notwendig ist (oder bestimmte Sortierungen verlangt werden), gehts mit einem `set` einfacher.

```

1 VISIT(v):
2   forall e=(v,w) in E
3     delete e from E
4   VISIT(w)
5   print e

```

Abbildung 1: Idee für Eulerzyklen

```

1 vector< vector<int> > adjlist;
2 vector< vector<int> > otherIdx;
3 vector<int> cycle;
4 vector<int> validIdx;
5
6 void swapEdges(int n, int a, int b) { // Vertauscht Kanten mit Indizes a und b von Knoten n.
7     int neighA = adjlist[n][a];
8     int neighB = adjlist[n][b];
9     int idxNeighA = otherIdx[n][a];
10    int idxNeighB = otherIdx[n][b];
11    swap(adjlist[n][a], adjlist[n][b]);
12    swap(otherIdx[n][a], otherIdx[n][b]);
13    otherIdx[neighA][idxNeighA] = b;
14    otherIdx[neighB][idxNeighB] = a;
15 }
16
17 void removeEdge(int n, int i) { // Entfernt Kante i von Knoten n (und die zugehoerige Rueckwaerts-kante)
18     int other = adjlist[n][i];
19     if (other == n) { //Schlingen
20         validIdx[n]++;
21         return;
22     }
23     int otherIndex = otherIdx[n][i];
24     validIdx[n]++;
25     if (otherIndex != validIdx[other]) {
26         swapEdges(other, otherIndex, validIdx[other]);
27     }
28     validIdx[other]++;
29 }
30
31 //findet Eulerzyklus an Knoten n startend
32 //teste vorher, dass Graph zusammenhaengend ist! (isolierte Punkte sind ok)
33 //teste vorher, ob Eulerzyklus ueberhaupt existiert!
34 void euler(int n) {
35     while (validIdx[n] < (int)adjlist[n].size()) {
36         int nn = adjlist[n][validIdx[n]];
37         removeEdge(n, validIdx[n]);
38         euler(nn);
39     }
40     cycle.push_back(n); //Zyklus am Ende in cycle
41 }

```

## 2.6 Max-Flow (EDMONDS-KARP-Algorithmus)

```

1 int s, t, f; //source, target, single flow
2 int res[MAX_V][MAX_V]; //adj-matrix
3 vector< vector<int> > adjList;
4 int p[MAX_V]; //bfs spanning tree
5
6 void augment(int v, int minEdge) {
7     if (v == s) { f = minEdge; return; }

```

```

8   else if (p[v] != -1) {
9       augment(p[v], min(minEdge, res[p[v]][v]));
10      res[p[v]][v] -= f; res[v][p[v]] += f;
11  }}
12
13  int maxFlow() { //first initialize res, adjList, s and t
14      int mf = 0;
15      while (true) {
16          f = 0;
17          bitset<MAX_V> vis; vis[s] = true;
18          queue<int> q; q.push(s);
19          memset(p, -1, sizeof(p));
20          while (!q.empty()) { //BFS
21              int u = q.front(); q.pop();
22              if (u == t) break;
23              for (int j = 0; j < (int)adjList[u].size(); j++) {
24                  int v = adjList[u][j];
25                  if (res[u][v] > 0 && !vis[v]) {
26                      vis[v] = true; q.push(v); p[v] = u;
27                  }
28              }
29              augment(t, INF); //add found path to max flow
30              if (f == 0) break;
31              mf += f;
32          }
33          return mf;
34      }

```

### 3 Geometrie

#### 3.1 Closest Pair

```

1  double squaredDist(point a, point b) {
2      return (a.first-b.first) * (a.first-b.first) + (a.second-b.second) * (a.second-b.second);
3  }
4
5  bool compY(point a, point b) {
6      if (a.second == b.second) return a.first < b.first;
7      return a.second < b.second;
8  }
9
10 double shortestDist(vector<point> &points) {
11     //check that points.size() > 1 and that ALL POINTS ARE DIFFERENT
12     set<point, bool(*)>(point, point)> status(compY);
13     sort(points.begin(), points.end());
14     double opt = 1e30, sqrtOpt = 1e15;
15     auto left = points.begin(), right = points.begin();
16     status.insert(*right); right++;
17
18     while (right != points.end()) {
19         if (fabs(left->first - right->first) >= sqrtOpt) {
20             status.erase(*(left++));
21         } else {
22             auto lower = status.lower_bound(point(-1e20, right->second - sqrtOpt));
23             auto upper = status.upper_bound(point(-1e20, right->second + sqrtOpt));
24             while (lower != upper) {
25                 double cand = squaredDist(*right, *lower);
26                 if (cand < opt) {
27                     opt = cand;
28                     sqrtOpt = sqrt(opt);
29                 }
30                 ++lower;
31             }
32             status.insert(*(right++));
33         }
34     }
35     return sqrtOpt;
36 }

```

#### 3.2 Geraden

```

1 struct pt { //complex<double> does not work here, because we need to set pt.x and pt.y
2     double x, y;
3     pt() {};}
4 pt(double x, double y) : x(x), y(y) {};
5 };
6
7 struct line {
8     double a, b, c; //a*x+b*y+c, b=0 <=> vertical line, b=1 <=> otherwise
9 };
10
11 line pointsToLine(pt p1, pt p2) {
12     line l;
13     if (fabs(p1.x - p2.x) < EPSILON) {
14         l.a = 1; l.b = 0.0; l.c = -p1.x;
15     } else {
16         l.a = -(double)(p1.y - p2.y) / (p1.x - p2.x);
17         l.b = 1.0;

## 4 Mathe

### 4.1 ggT, kgV, erweiterter euklidischer Algorithmus

```

1 ll gcd(ll a, ll b) {
2     return b == 0 ? a : gcd(b, a % b);
3 }
4
5 ll lcm(ll a, ll b) {
6     return a * (b / gcd(a, b)); //Klammern gegen Overflow
7 }

1 //Accepted in Aufgabe mit Forderung: |X|+|Y| minimal (primaer) und X<=Y (sekundaer)
2 //hab aber keinen Beweis dafuer :)
3 ll x, y, d; //a * x + b * y = d = ggT(a,b)
4 void extendedEuclid(ll a, ll b) {
5     if (!b) {
6         x = 1; y = 0; d = a; return;
7     }
8     extendedEuclid(b, a % b);
9     ll x1 = y; ll y1 = x - (a / b) * y;
10    x = x1; y = y1;
11 }

```

#### 4.1.1 Multiplikatives Inverses von $x$ in $\mathbb{Z}/n\mathbb{Z}$

Sei  $0 \leq x < n$ . Definiere  $d := \gcd(x, n)$ .

Falls  $d = 1$ :

- Erweiterter euklidischer Algorithmus liefert  $\alpha$  und  $\beta$  mit  $\alpha x + \beta n = 1$
- Nach Kongruenz gilt  $\alpha x + \beta n \equiv \alpha x \equiv 1 \pmod{n}$
- $x^{-1} := \alpha \pmod{n}$

Falls  $d \neq 1$ : es existiert kein  $x^{-1}$

```

1 ll multInv(ll n, ll p) { //berechnet das multiplikative Inverse von n in F_p
2     extendedEuclid(n, p); //implementierung von oben
3     x += ((x / p) + 1) * p;
4     return x % p;
5 }

```

## 4.2 Primzahlsieb von Eratosthenes

```

1 vector<int> primes;
2 void primeSieve(ll n) { //berechnet die Primzahlen kleiner n
3     vector<int> isPrime(n, true);
4     for(ll i = 2; i < n; i+=2) {
5         if(isPrime[i]) {
6             primes.push_back(i);
7             if(i*i <= n) {
8                 for(ll j = i; i*j < n; j+=2) isPrime[i*j] = false;
9             }
10        }
11        if(i == 2) i--;
12    }
13 }

```

### 4.2.1 Faktorisierung

```

1 const ll PRIME_SIZE = 10000000;
2 vector<int> primes; //call primeSieve(PRIME_SIZE); before
3
4 //Factorize the number n
5 vector<int> factorize(ll n) {
6     vector<int> factor;
7     ll num = n;
8     int pos = 0;
9     while(num != 1) {
10        if(num % primes[pos] == 0) {
11            num /= primes[pos];
12            factor.push_back(primes[pos]);
13        }
14        else pos++;
15        if(primes[pos]*primes[pos] > n) break;
16    }
17    if(num != 1) factor.push_back(num);
18    return factor;
19 }

```

### 4.2.2 Mod-Exponent über $\mathbb{F}_p$

```

1 ll modPow(ll b, ll e, ll p) {
2     if (e == 0) return 1;
3     if (e == 1) return b;
4     ll half = modPow(b, e / 2, p), res = (half * half) % p;
5     if (e & 1) res *= b; res %= p;
6     return res;
7 }

```

## 4.3 LGS über $\mathbb{F}_p$

```

1 void normalLine(ll n, ll line, ll p) { //normalisiert Zeile line
2     ll factor = multInv(mat[line][line], p); //Implementierung von oben
3     for (ll i = 0; i <= n; i++) {
4         mat[line][i] *= factor;
5         mat[line][i] %= p;
6     }
7 }
8
9 void takeAll(ll n, ll line, ll p) { //zieht Vielfaches von line von allen anderen Zeilen ab
10    for (ll i = 0; i < n; i++) {
11        if (i == line) continue;
12        ll diff = mat[i][line]; //abziehen
13        for (ll j = 0; j <= n; j++) {

```

```

14     mat[i][j] -= (diff * mat[line][j]) % p;
15     while (mat[i][j] < 0) {
16         mat[i][j] += p;
17     }
18 }
19 }
20 }
21
22 void gauss(ll n, ll p) { //n x n+1-Matrix, Koerper F_p
23     for (ll line = 0; line < n; line++) {
24         normalLine(n, line, p);
25         takeAll(n, line, p);
26     }
27 }

```

## 4.4 Binomialkoeffizienten

```

1 ll calc_binom(ll N, ll K) {
2     ll r = 1, d;
3     if (K > N) return 0;
4     for (d = 1; d <= K; d++) {
5         r *= N--;
6         r /= d;
7     }
8     return r;
9 }

```

## 4.5 Satz von SPRAGUE-GRUNDY

Weise jedem Zustand  $X$  wie folgt eine GRUNDY-Zahl  $g(X)$  zu:

$$g(X) := \min\{\mathbb{Z}_0^+ \setminus \{g(Y) \mid Y \text{ von } X \text{ aus direkt erreichbar}\}\}$$

$X$  ist genau dann gewonnen, wenn  $g(X) > 0$  ist.

Wenn man  $k$  Spiele in den Zuständen  $X_1, \dots, X_k$  hat, dann ist die GRUNDY-Zahl des Gesamtzustandes  $g(X_1) \oplus \dots \oplus g(X_k)$ .

## 4.6 Maximales Teilfeld

```

1 //N := length of field
2 int maxStart = 1, maxLen = 0, curStart = 1, len = 0;
3 double maxValue = 0, sum = 0;
4 for (int pos = 0; pos < N; pos++) {
5     sum += values[pos];
6     len++;
7     if (sum > maxValue) { // neues Maximum
8         maxValue = sum; maxStart = curStart; maxLen = len;
9     }
10    if (sum < 0) { // alles zuruecksetzen
11        curStart = pos + 2; len = 0; sum = 0;
12    }
13 }
14 //maxSum := maximaler Wert, maxStart := Startposition, maxLen := Laenge der Sequenz

```

Obiger Code findet kein maximales Teilfeld, das über das Ende hinausgeht. Dazu:

1. finde maximales Teilfeld, das nicht übers Ende geht
2. berechne minimales Teilfeld, das nicht über den Rand geht (analog)
3. nimm Maximum aus gefundenem Maximalem und Allem\Minimalem

# 5 Strings

## 5.1 KNUTH-MORRIS-PRATT-Algorithmus

```

1 #include <iostream>
2 #include <vector>
3

```

```

4 using namespace std;
5
6 //Preprocessing Substring sub for KMP-Search

23        while(a[i].i+c < s[a[i].s].length() && a[i+1].i+c < s[a[i+1].s].length() && s[a[i].s][a[i].i+c] ==
24            s[a[i+1].s][a[i+1].i+c]) c++;
25        if(c > m) r=i, m=c;
26    }
27    return m == 0 ? "" : s[a[r].s].substr(a[r].i, m);
28 }

```

## 5.5 Longest Common Subsequence

```

1 string lcsub(string &a, string &b) {
2     int m[a.length() + 1][b.length() + 1], x=0, y=0;
3     memset(m, 0, sizeof(m));
4     for(int y = a.length() - 1; y >= 0; y--) {
5         for(int x = b.length() - 1; x >= 0; x--) {
6             if(a[y] == b[x]) m[y][x] = 1 + m[y+1][x+1];
7             else m[y][x] = max(m[y+1][x], m[y][x+1]);
8         }
9     } //for length only: return m[0][0];

```

```
10  string res;
11  while(x < b.length() && y < a.length()) {
12      if(a[y] == b[x]) res += a[y++], x++;
13      else if(m[y][x+1] > m[y+1][x+1]) x++;
14      else y++;
15  }
16  return res;
17 }
```

## 6 Sonstiges

### 6.1 2-SAT

1. Bedingungen in 2-CNF formulieren.
2. Implikationsgraph bauen,  $(a \vee b)$  wird zu  $\neg a \Rightarrow b$  und  $\neg b \Rightarrow a$ .
3. Finde die starken Zusammenhangskomponenten.
4. Genau dann lösbar, wenn keine Variable mit ihrer Negation in einer SCC liegt.
